

CS 325 I - Computer Networks I: Reliable Data Transfer

Professor Patrick Traynor Lecture 08 9/12/13

Announcements

- Project I is due today
 - Submit your tarball via T-Square.
 - Due by 5pm!
- Project 2 will be posted by Tuesday.
 - We will talk about the details in class on Tuesday.
 - Get started soon! This will require a significant amount of effort to get done.
- Homework 2 has been posted
 - Submission deadline pushed back to 10/1

Last Time

- Multiplexing/Demultiplexing at the Transport Layer.
 - How do TCP and UDP differ?
- UDP gives us virtually "bare-bones" access to the network layer.
 - What are the four fields in a UDP header?
- What is port scanning?
 - How can it be used to protect systems? To attack them?

Chapter 3 outline

- 3.1 Transport-layer services
- 3.2 Multiplexing and demultiplexing
- 3.3 Connectionless transport: UDP
- 3.4 Principles of reliable data transfer

- 3.5 Connection-oriented transport: TCP
 - segment structure
 - reliable data transfer
 - flow control
 - connection management
- 3.6 Principles of congestion control
- 3.7 TCP congestion control

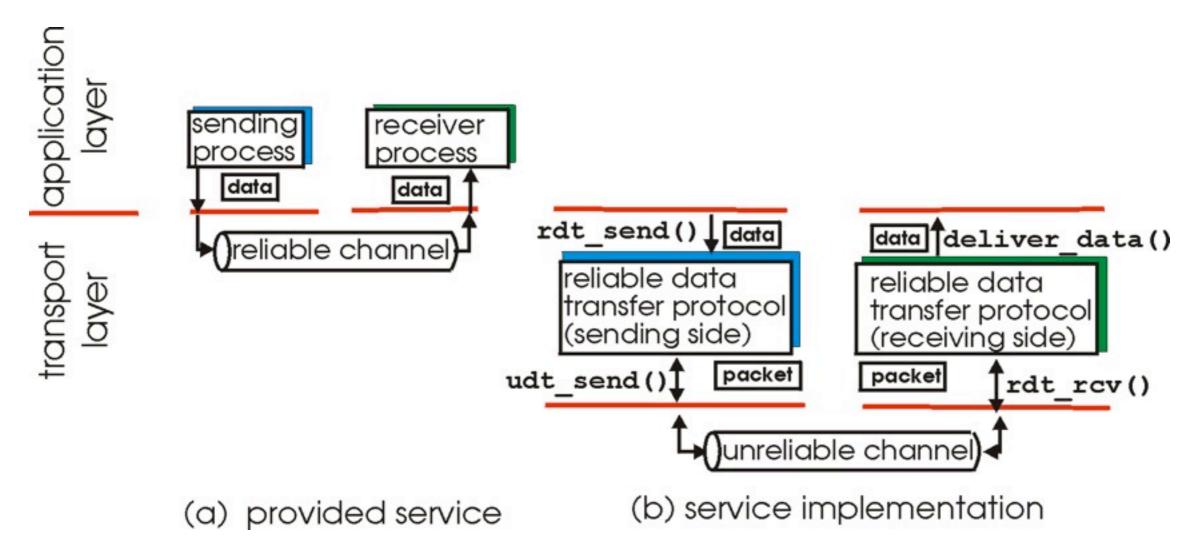

Problem Solving

- Given all of our talk about TCP, you might assume that describing how it works is straightforward.
- The reality is that there are lots of different ways that we could have provided "reliable" delivery.
 - Here is where we will really start to see design tradeoffs.
- It's time in your CS career to be creative...
 - Let's solve some problems.

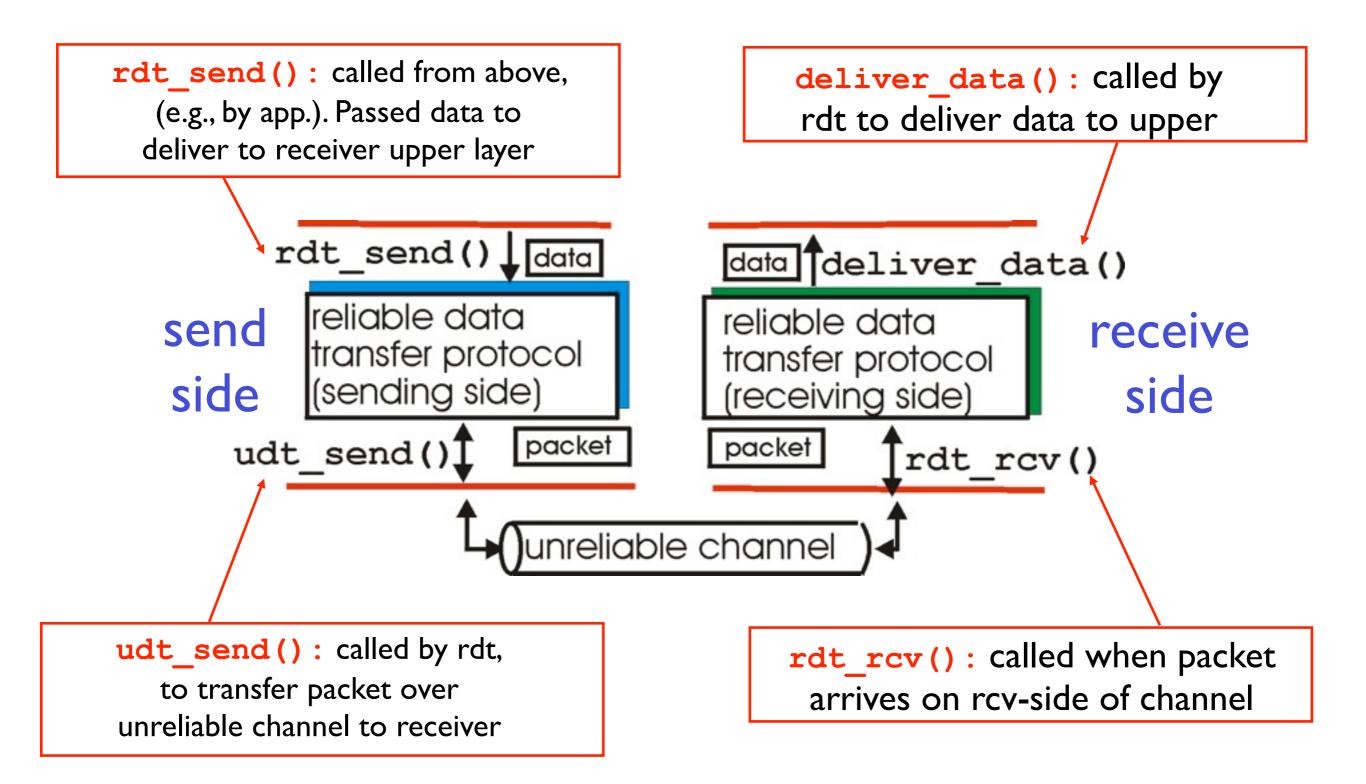

Principles of Reliable data transfer

- important in app., transport, link layers
- top-10 list of important networking topics!

 characteristics of unreliable channel will determine complexity of reliable data transfer protocol (rdt)

Reliable data transfer: getting started

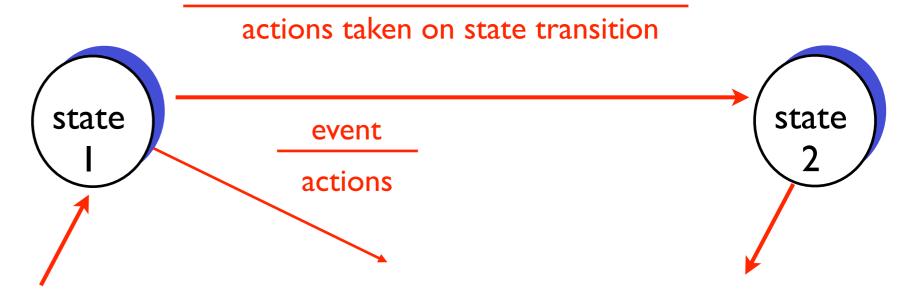

Reliable data transfer: getting started

We'll:

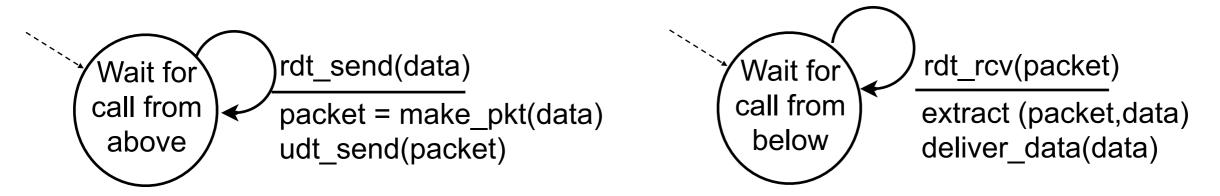

- incrementally develop sender, receiver sides of reliable data transfer protocol (rdt)
- consider only unidirectional data transfer
 - but control info will flow on both directions!
- use finite state machines (FSM) to specify sender,
 receiver
 event causing state transition

state: when in this "state"
next state uniquely
determined by next
event

Rdt 1.0: reliable transfer over a reliable channel

- underlying channel perfectly reliable
 - no bit errors
 - no loss of packets
- separate FSMs for sender, receiver:
 - sender sends data into underlying channel
 - receiver read data from underlying channel

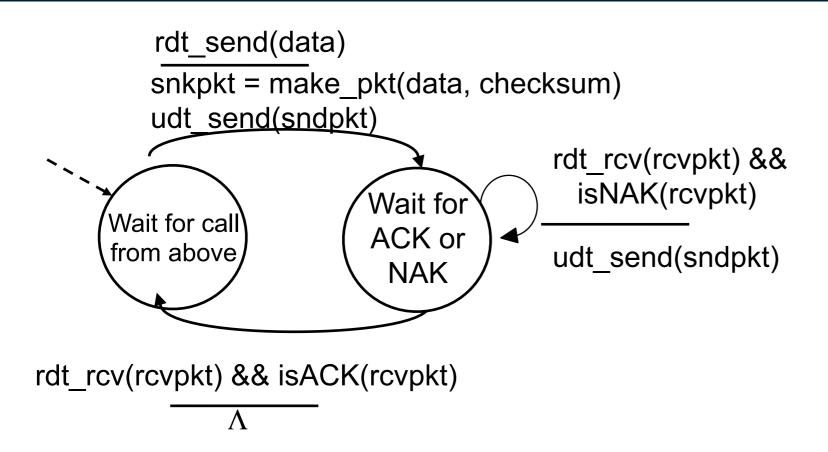

sender

receiver

Rdt2.0: channel with bit errors

- underlying channel may flip bits in packet
 - checksum to detect bit errors
- the question: how to recover from errors:
 - acknowledgements (ACKs): receiver explicitly tells sender that pkt received OK
 - negative acknowledgements (NAKs): receiver explicitly tells sender that pkt had errors
 - sender retransmits pkt on receipt of NAK
- new mechanisms in rdt2.0 (beyond rdt1.0):
 - error detection
 - receiver feedback: control msgs (ACK,NAK) rcvr->sender

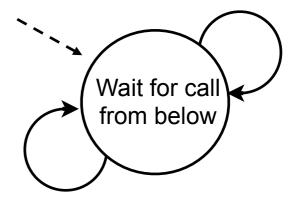

rdt2.0: FSM specification

sender

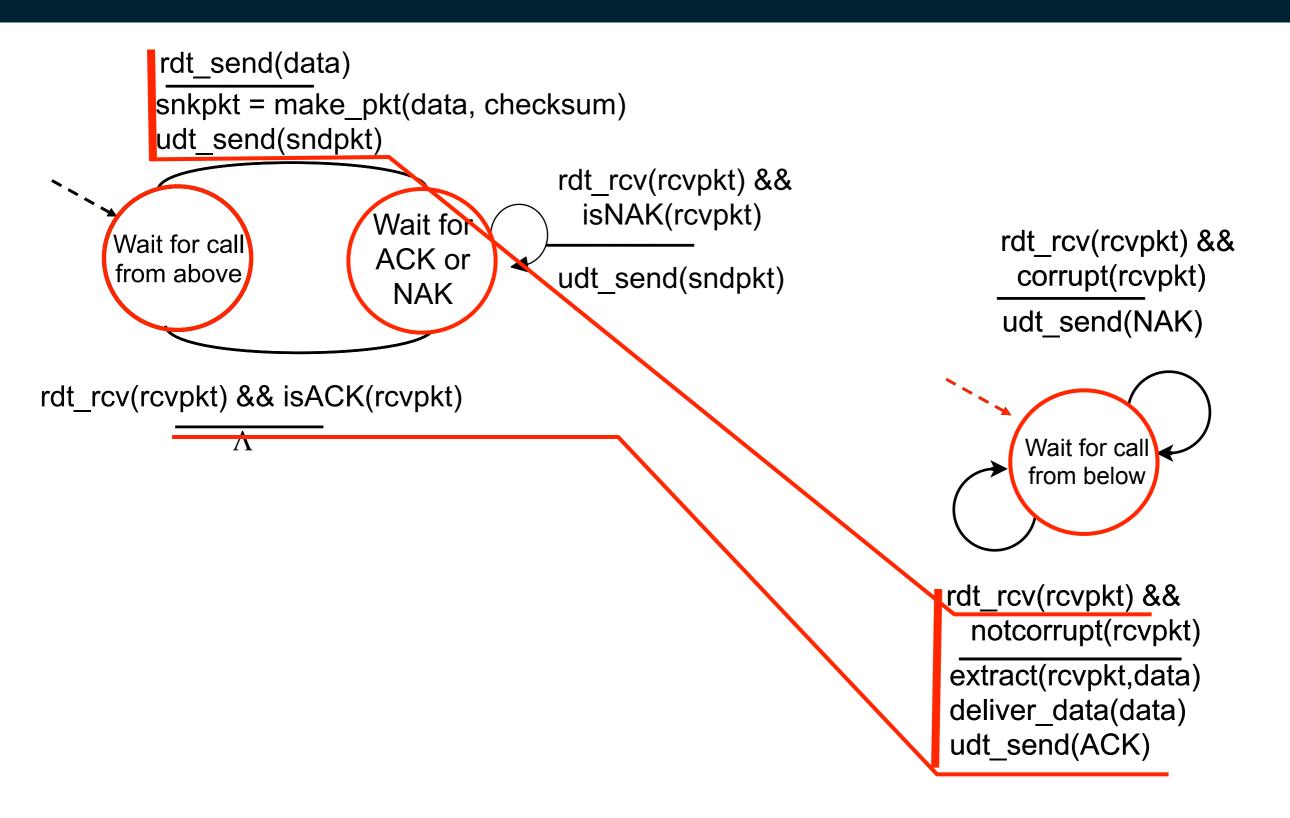

receiver

rdt_rcv(rcvpkt) && corrupt(rcvpkt) udt_send(NAK)

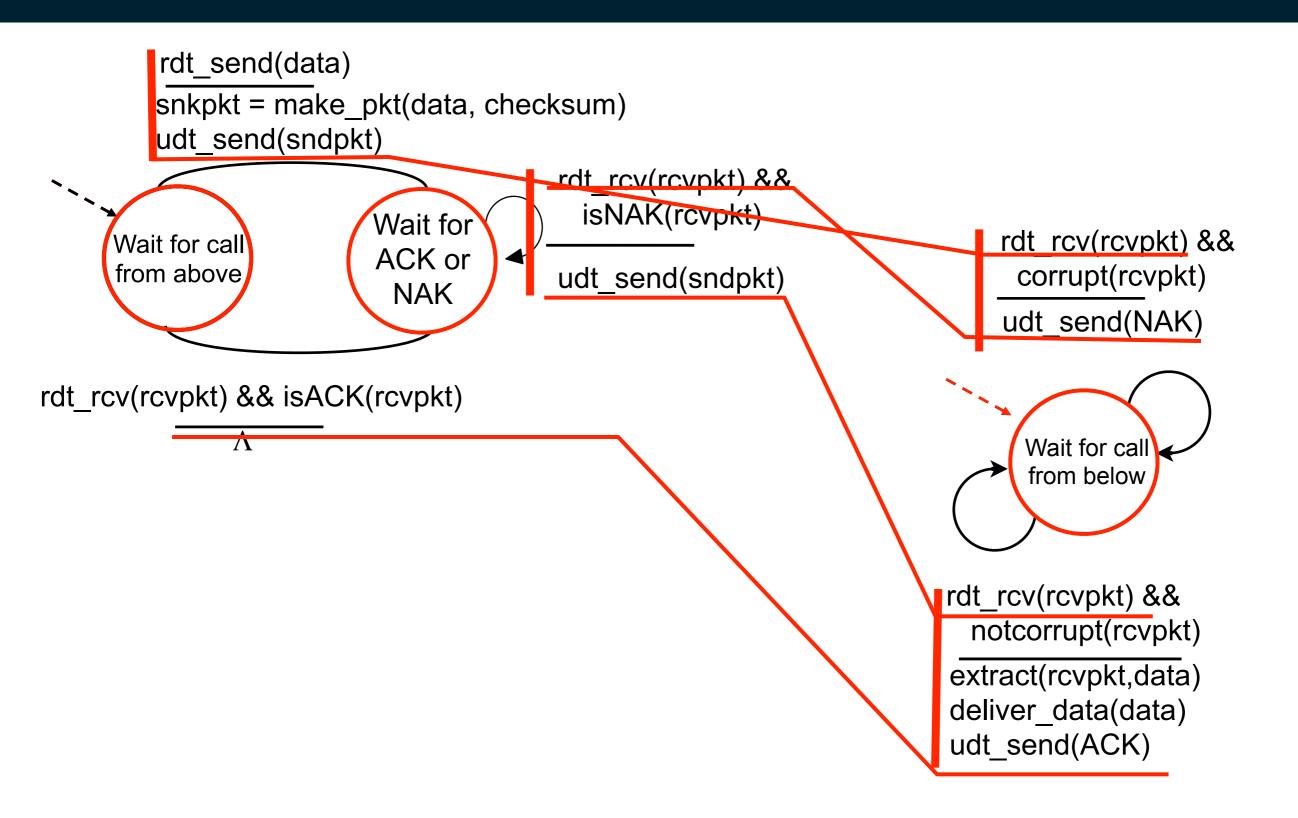

rdt_rcv(rcvpkt) &&
 notcorrupt(rcvpkt)
extract(rcvpkt,data)
deliver_data(data)
udt_send(ACK)

rdt2.0: operation with no errors

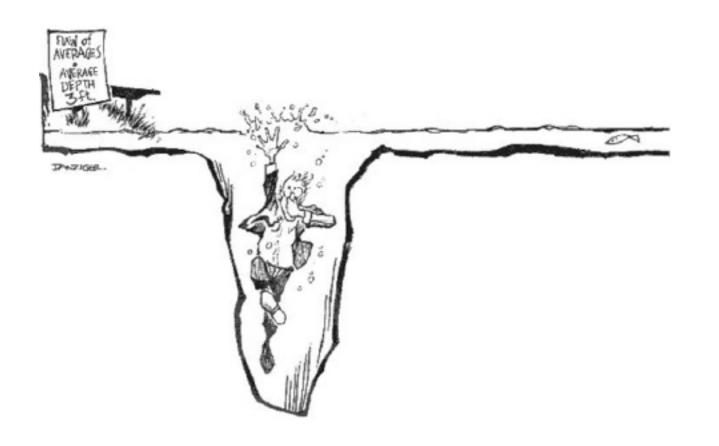

rdt2.0: error scenario

rdt2.0 has a fatal flaw!

What happens if ACK/NAK corrupted?

- sender doesn't know what happened at receiver!
- can't just retransmit: possible duplicate

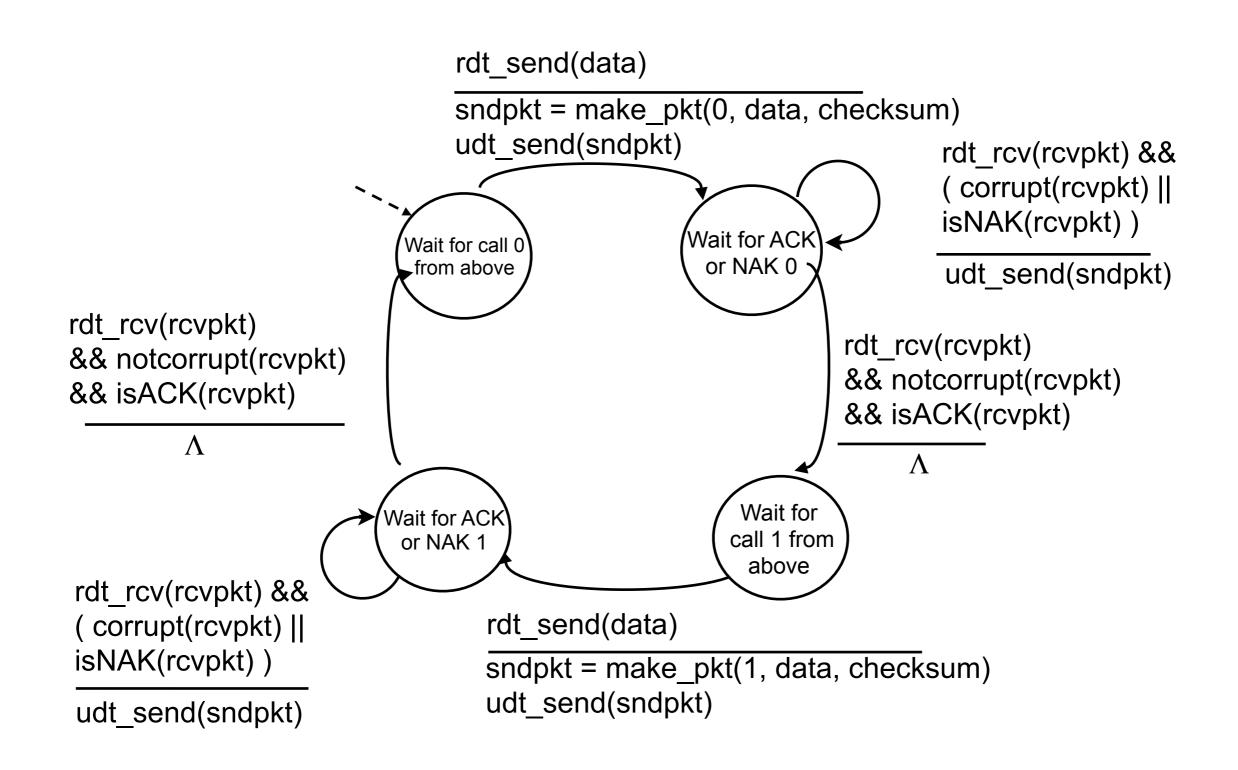

Handling duplicates:

- sender retransmits current pkt if ACK/NAK garbled
- sender adds sequence number to each pkt
- receiver discards (doesn't deliver up) duplicate pkt

stop and wait

Sender sends one packet, then waits for receiver response

rdt2.1: sender, handles garbled ACK/NAKs

rdt2.1: receiver, handles garbled ACK/NAKs

rdt rcv(rcvpkt) && notcorrupt(rcvpkt) && has seq0(rcvpkt) extract(rcvpkt,data) deliver data(data) sndpkt = make pkt(ACK, chksum) udt send(sndpkt) rdt rcv(rcvpkt) && (corrupt(rcvpkt) sndpkt = make_pkt(NAK, chksum) udt_send(sndpkt) Wait for Wait for 0 from 1 from rdt rcv(rcvpkt) && below below not corrupt(rcvpkt) && has_seq1(rcvpkt) sndpkt = make pkt(ACK, chksum) udt send(sndpkt) rdt_rcv(rcvpkt) && notcorrupt(rcvpkt) && has seq1(rcvpkt) extract(rcvpkt,data)

deliver data(data)

udt send(sndpkt)

sndpkt = make pkt(ACK, chksum)

rdt_rcv(rcvpkt) && (corrupt(rcvpkt)
sndpkt = make_pkt(NAK, chksum)
udt_send(sndpkt)

rdt_rcv(rcvpkt) && not corrupt(rcvpkt) && has_seq0(rcvpkt)

sndpkt = make_pkt(ACK, chksum)
udt_send(sndpkt)

rdt2.1: discussion

Sender:

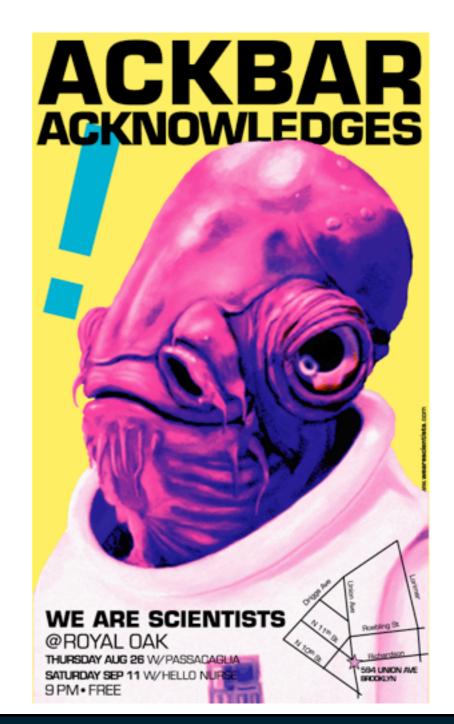

- seq # added to pkt
- two seq. #'s (0, I) will suffice. Why?
- must check if received ACK/NAK corrupted
- twice as many states
 - state must "remember" whether "current" pkt has 0 or 1 seq. #

Receiver:

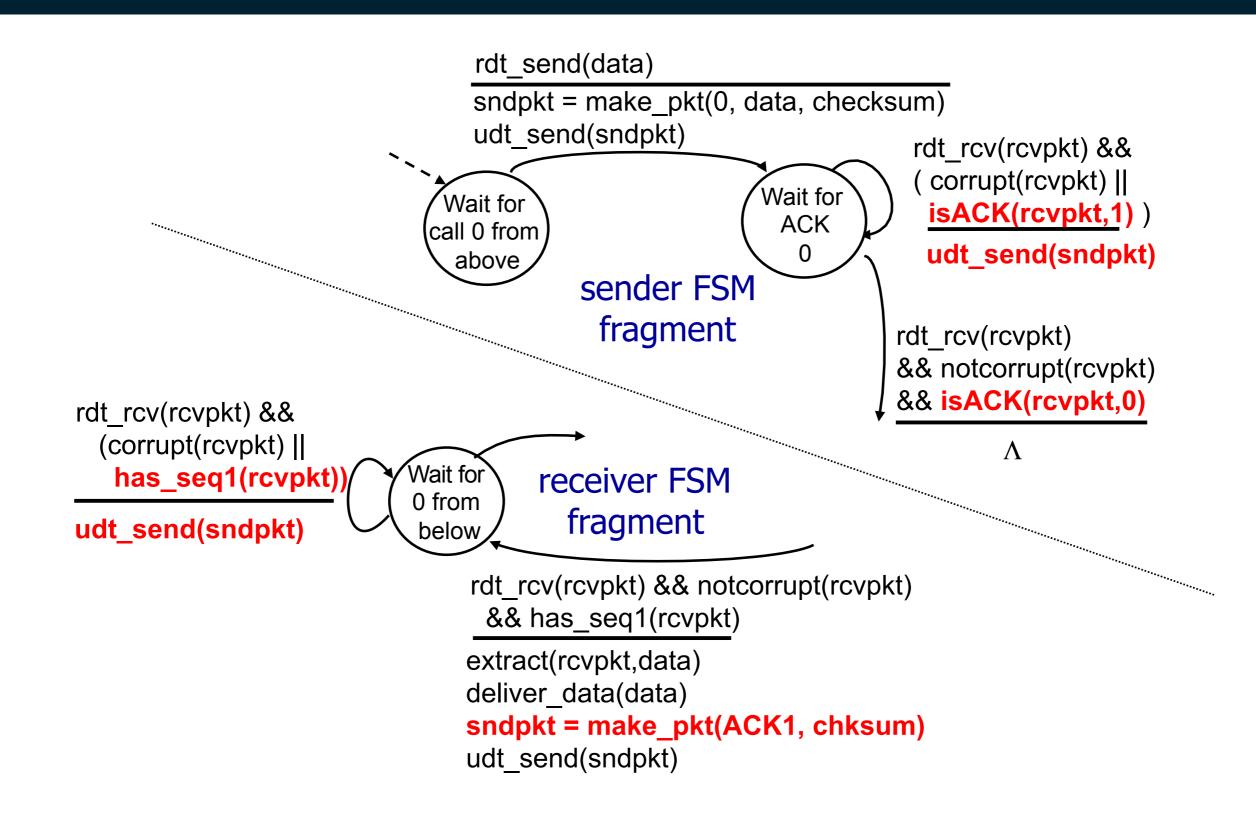

- must check if received packet is duplicate
 - state indicates whether 0 or I is expected pkt seq #
- note: receiver can not know if its last ACK/NAK received OK at sender

rdt2.2: a NAK-free protocol

- same functionality as rdt2.1, using ACKs only
- instead of NAK, receiver sends ACK for last pkt received OK
 - receiver must explicitly include seq # of pkt being ACKed
- duplicate ACK at sender results in same action as NAK: retransmit current pkt

rdt2.2: sender, receiver fragments

rdt3.0: channels with errors and loss

New assumption: underlying channel can also lose packets (data or ACKs)

 checksum, seq. #, ACKs, retransmissions will be of help, but not enough

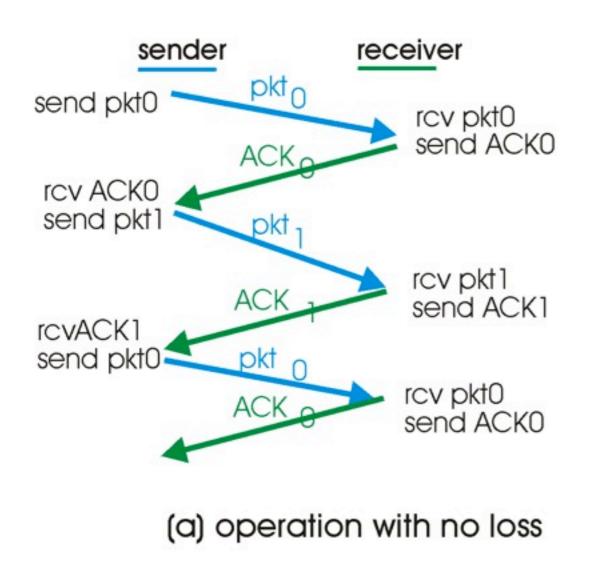

Approach: sender waits "reasonable" amount of time for ACK

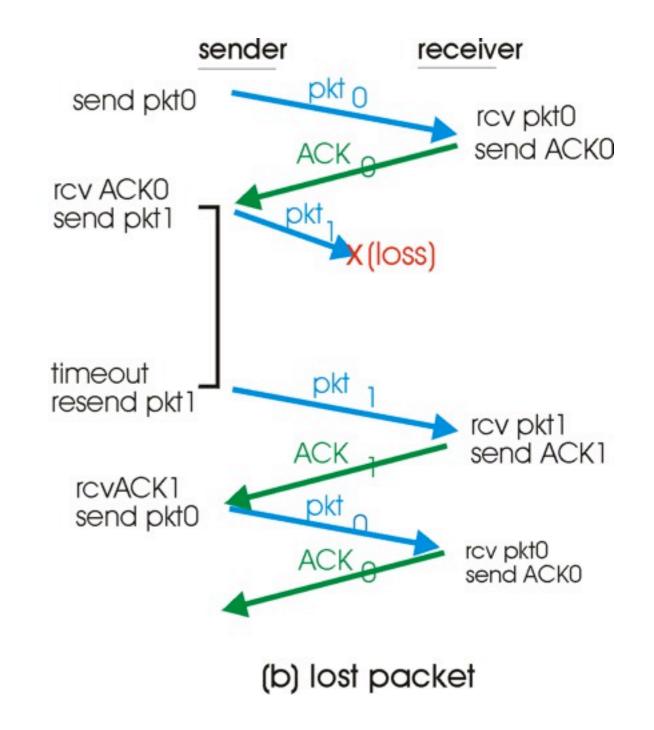

- retransmits if no ACK received in this time
- if pkt (or ACK) just delayed (not lost):
 - retransmission will be duplicate, but use of seq. #'s already handles this
 - receiver must specify seq # of pkt being ACKed
- requires countdown timer

rdt3.0 sender

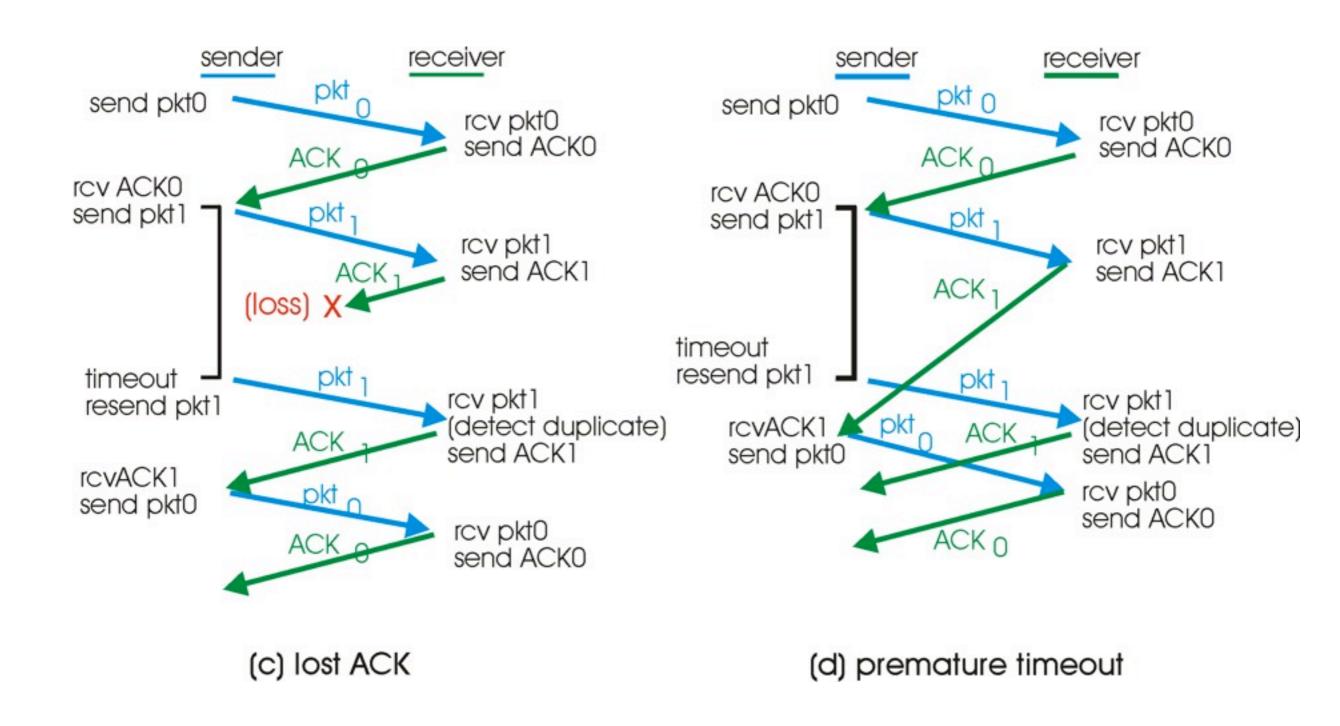

rdt3.0 in action

rdt3.0 in action

Performance of rdt3.0

- rdt3.0 works, but performance stinks
- example: I Gbps link, I5 ms e-e prop. delay, IKB packet:

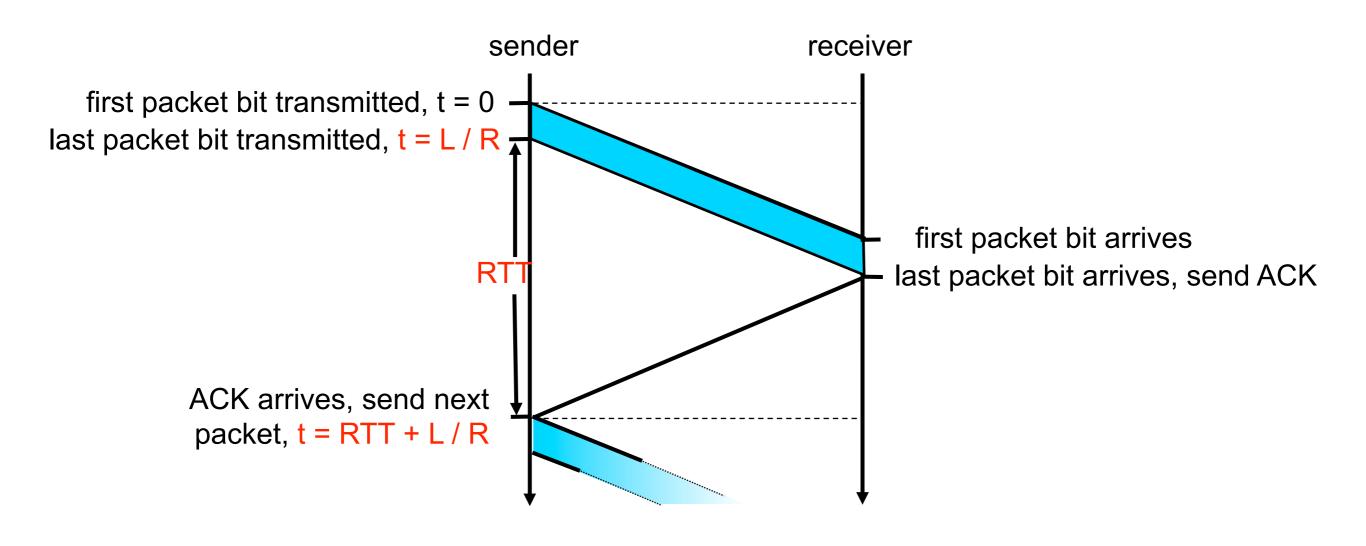

$$T_{transmit} = \frac{L \text{ (packet length in bits)}}{R \text{ (transmission rate, bps)}} = \frac{8kb/pkt}{10^9 \text{ b/sec}} = 8 \text{ microsec}$$

▶ U sender: utilization — fraction of time sender busy sending

$$U_{\text{sender}} = \frac{L/R}{RTT + L/R} = \frac{.008}{30.008} = 0.00027$$

- ▶ IKB pkt every 30 msec -> 33kB/sec throughput over I Gbps link
- network protocol limits use of physical resources!

rdt3.0: stop-and-wait operation

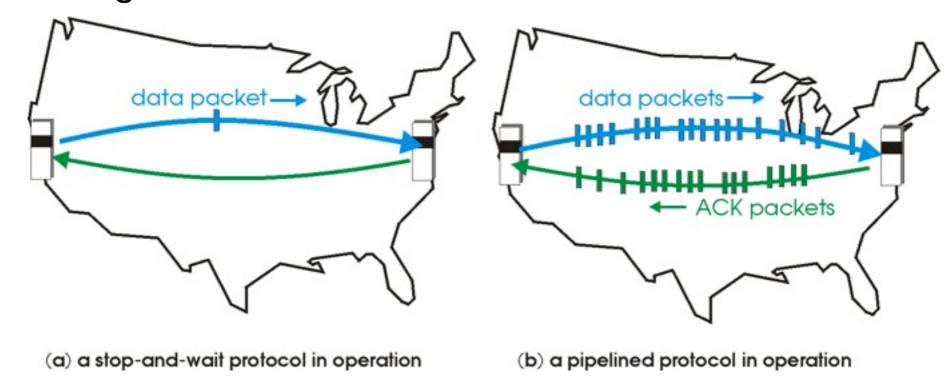

$$U_{\text{sender}} = \frac{L/R}{RTT + L/R} = \frac{.008}{30.008} = 0.00027$$

Pipelined protocols

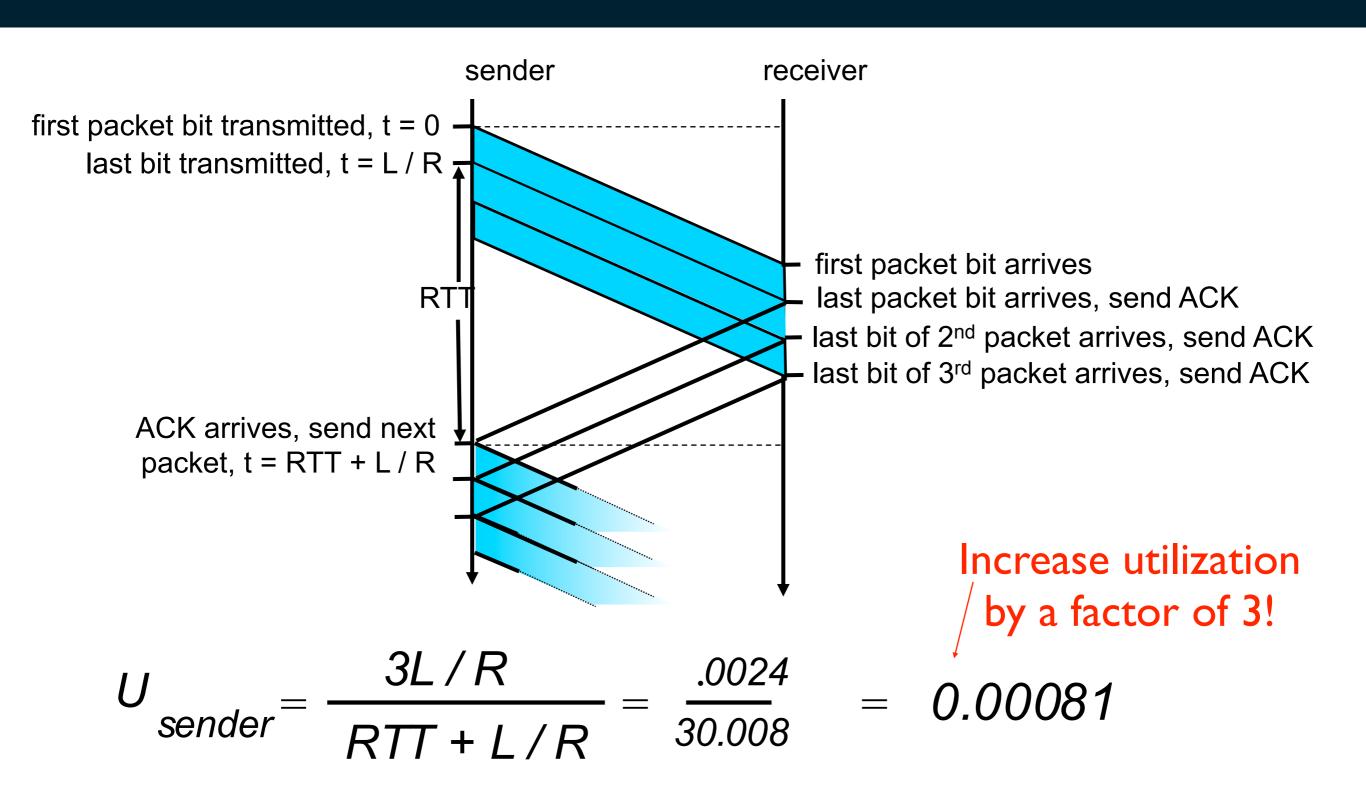

Pipelining: sender allows multiple, "in-flight", yet-to-be-acknowledged pkts

- range of sequence numbers must be increased
- buffering at sender and/or receiver

 Two generic forms of pipelined protocols: go-Back-N, selective repeat

Pipelining: increased utilization

Pipelining Protocols

- Go-back-N: big picture:
 - Sender can have up to N un-ACKed packets in pipeline
 - Rcvr only sends cumulative acks
 - Doesn't ack packet if there's a gap
 - Sender has timer for oldest unacked packet
 - If timer expires, retransmit all unacked packets

Selective Repeat: Big Picture

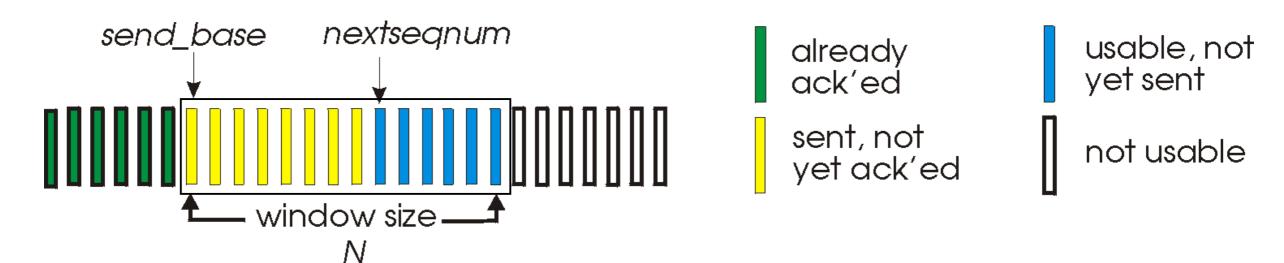

- Sender can have up to N unacked packets in pipeline
- Rcvr acks individual packets
- Sender maintains timer for each unacked packet
 - When timer expires, retransmit only individual unacked packet.

Go-Back-N

Sender:

- k-bit seq # in pkt header
- "window" of up to N, consecutive unack'ed pkts allowed

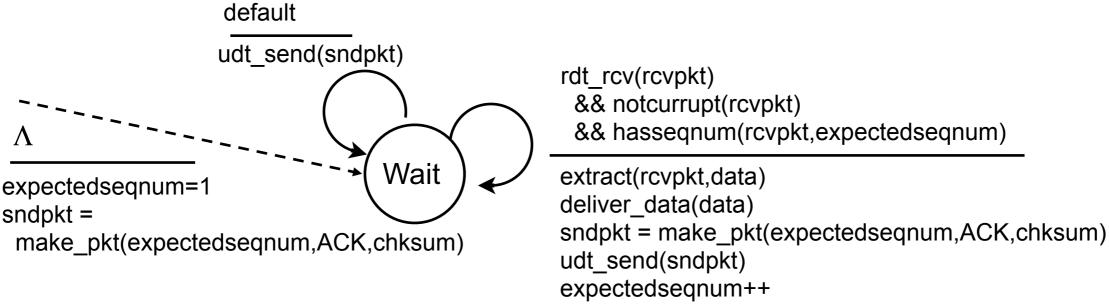

- ACK(n):ACKs all pkts up to, including seq # n "cumulative ACK"
 - may receive duplicate ACKs (see receiver)
- timer for each in-flight pkt
- timeout(n): retransmit pkt n and all higher seq # pkts in window

GBN: sender extended FSM

```
rdt_send(data)
                          if (nextseqnum < base+N) {
                            sndpkt[nextseqnum] = make_pkt(nextseqnum,data,chksum)
                            udt_send(sndpkt[nextseqnum])
                            if (base == nextseqnum)
                              start timer
                            nextseqnum++
                          else
                           refuse data(data)
    Λ
   base=1
   nextseqnum=1
                                               timeout
                                               start timer
                                 Wait
                                               udt_send(sndpkt[base])
                                               udt_send(sndpkt[base+1])
rdt rcv(rcvpkt)
 && corrupt(rcvpkt)
                                               udt_send(sndpkt[nextseqnum-1])
                            rdt_rcv(rcvpkt) &&
                              notcorrupt(rcvpkt)
                            base = getacknum(rcvpkt)+1
                            If (base == nextseqnum)
                              stop_timer
                             else
                              start_timer
```

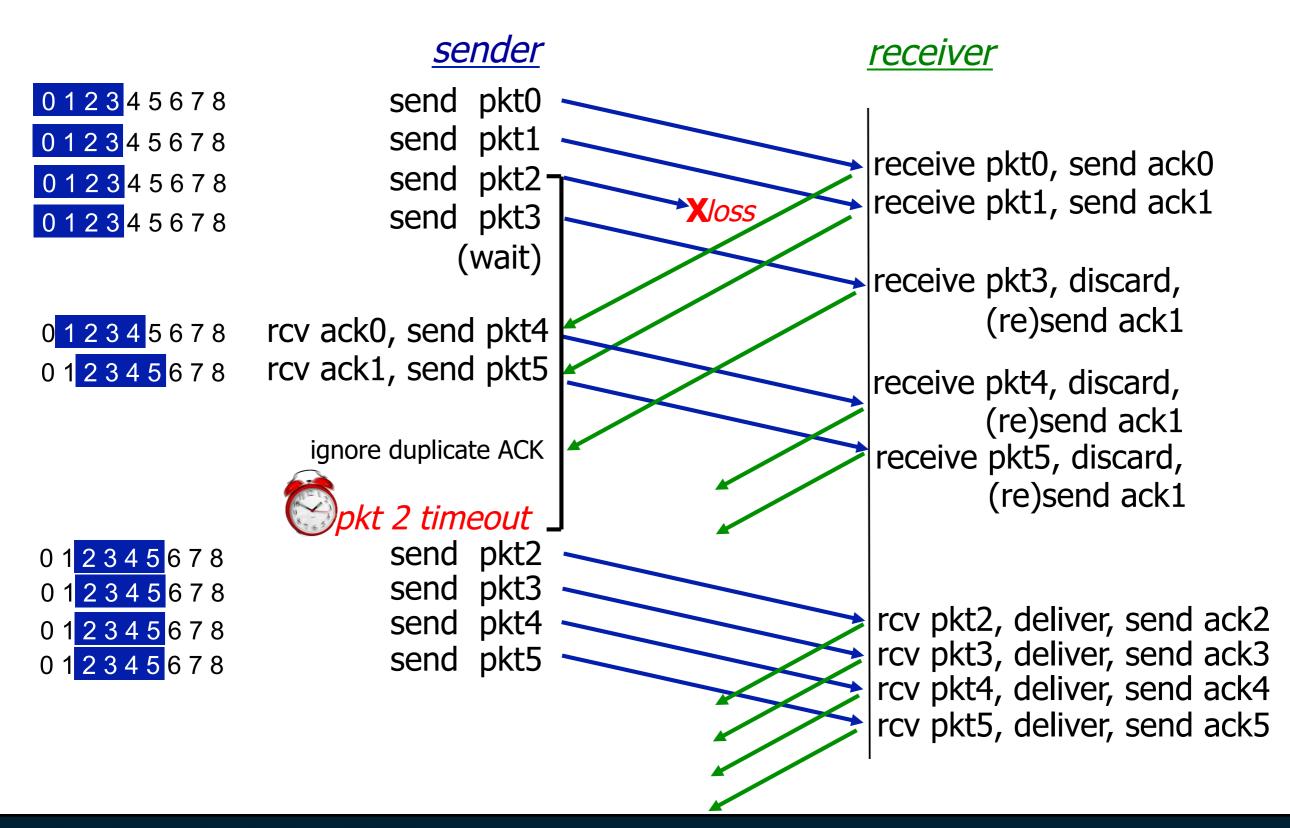

GBN: receiver extended FSM

ACK-only: always send ACK for correctly-received pkt with highest in-order seq

- may generate duplicate ACKs
- need only remember expectedseqnum
- out-of-order pkt:
 - discard (don't buffer) -> no receiver buffering!
 - Re-ACK pkt with highest in-order seq #

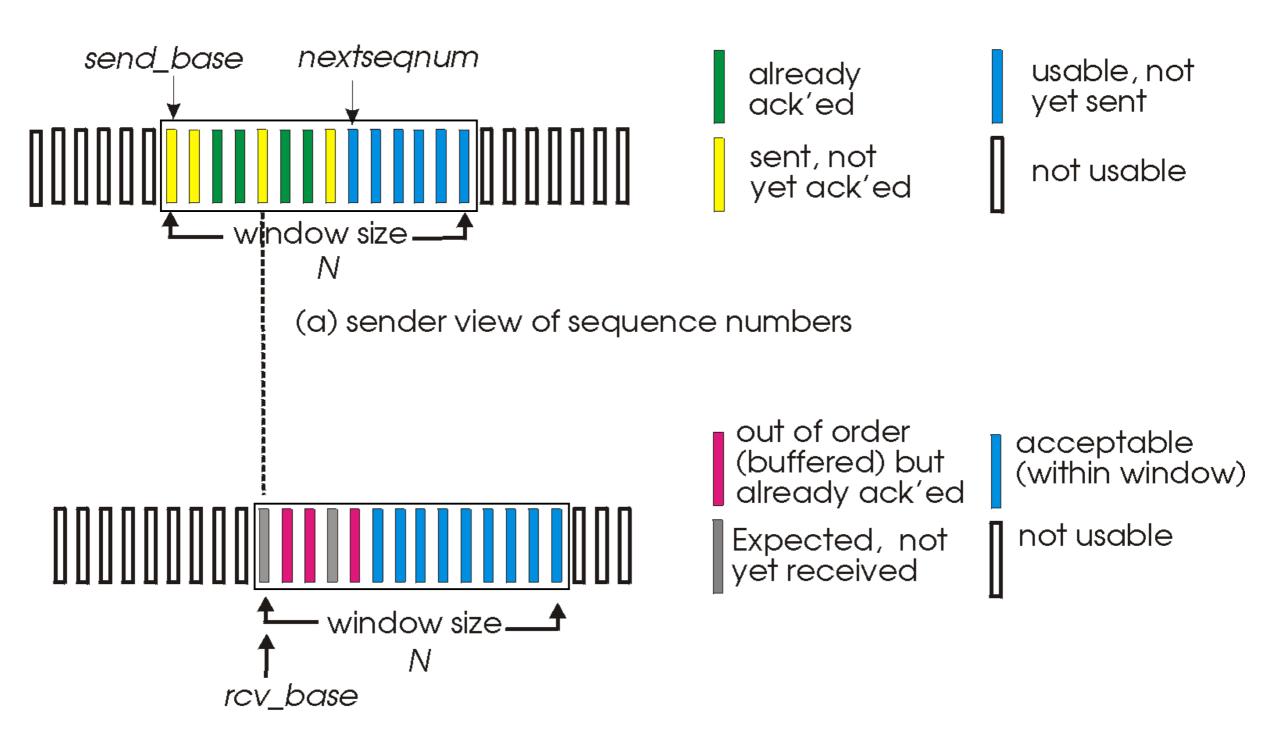

GBN in action

Selective Repeat

- receiver individually acknowledges all correctly received pkts
 - buffers pkts, as needed, for eventual in-order delivery to upper layer
- sender only resends pkts for which ACK not received
 - sender timer for each unACKed pkt
- sender window
 - N consecutive seq #'s
 - again limits seq #s of sent, unACKed pkts

Selective repeat: sender, receiver windows

(b) receiver view of sequence numbers

Selective repeat

sender -

data from above:

 if next available seq # in window, send pkt

timeout(n):

resend pkt n, restart timer

ACK(n) in [sendbase,sendbase+N]:

- mark pkt n as received
- if n smallest unACKed pkt, advance window base to next unACKed seq #

receiver

pkt n in [rcvbase, rcvbase+N-1]

- send ACK(n)
- out-of-order: buffer
- in-order: deliver (also deliver buffered, in-order pkts), advance window to next not-yet-received pkt

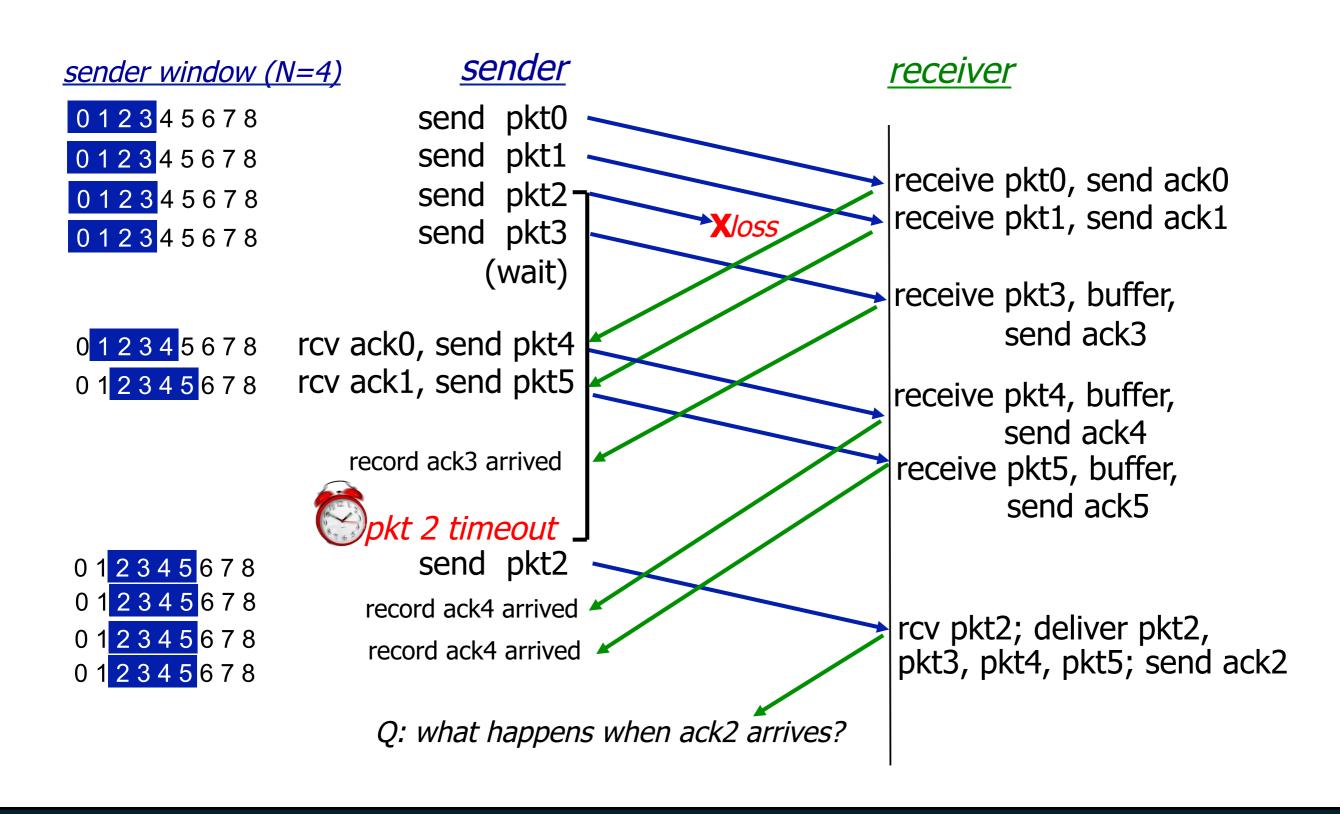

pkt n in [rcvbase-N,rcvbase-1]

ACK(n)

otherwise:

ignore

Selective repeat in action

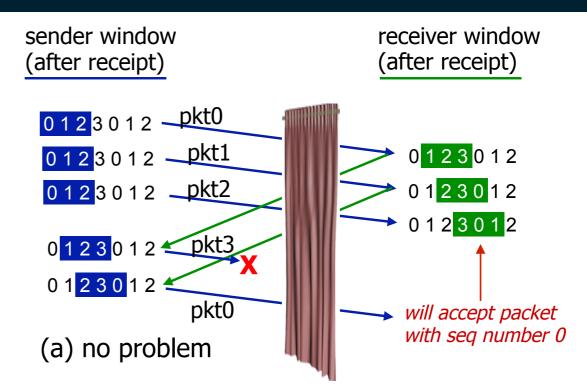

Selective repeat: dilemma

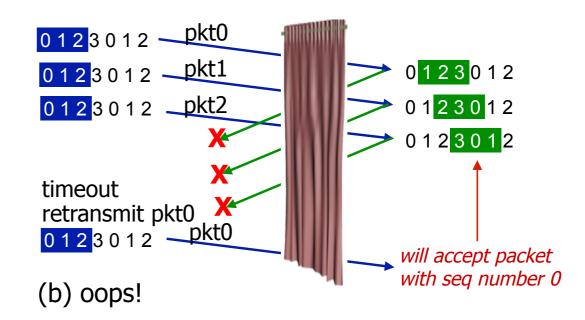

Example:

- seq #'s: 0, 1, 2, 3
- window size=3
- receiver sees no difference in two scenarios!
- incorrectly passes duplicate data as new in (a)

Q: what relationship between seq # size and window size?

receiver can't see sender side.
receiver behavior identical in both cases!
something's (very) wrong!

Next Time

- That was a lot of material...
 - Take time to look over the notes. Understand the differences between each of these schemes!
- Next Time
 - TCP and Congestion Control (Sections 3.5 and 3.6)
- Check the webpage for Homework 2 and (soon) Project 2!
